

1.3 At4g05160, At4CL-like7: CoA-4-ligase-like7

Col is slightly enriched in phenolic ester (1720 cm^{-1}), and unassigned absorbances, at 1161 , 1030 and 999 cm^{-1} . The mutant is relatively enriched in absorbances at 1662 and 1624 cm^{-1} , possibly arising from aromatic rings. No companion amide stretch is observed at 1550 cm^{-1} to indicate that these absorbances arise from protein.
